PREFACE

I feel immensely delighted to present this field report based on primary data collected from field survey and secondary data collected from different sources. In this report I have tried to give all the important and appropriate things about the report.

In this report, I have endeavoured to make this report attractive and easy to understand. Each and every topic of the report is well-explained in detail which will enhance the depth of the learning experience. I have also included pictures or diagrams related to the topics which is my creativity.

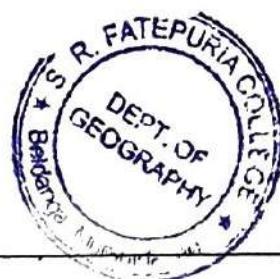

ACKNOWLEDGEMENT

Primarily I would thank god for being able to complete this field report with success. Then I would like to express my special thanks of gratitude to our teacher Mr. Abus Sattar Shaikh of the department of Geography, Sewnarayan Rameswar Fatepuria College. who give me the golden opportunity to do this wonderful report on the given topic which also help me in doing a lot of research and I came to know about so many new things, I am really thankful to them.

Secondly I am thankful to my parents to get me a moral support and guided me.

Last but not the least I would like to thank my friends, they also guided me in different matters regarding this report and they helped me a lot in finalizing this report within the limited frame of time.

Atanu Saha

3	Bar graph (Occupations)	12
4	Bar graph (Annual Income)	12

ROUTE MAP

LOCATION MAP OF STUDY AREA (BELIA KHARI)

- ③ Arun Makal et al (2017), in their study issues and problem in agricultural development. A study on the farmers of west Bengal has found that huge number of farmers suffered by lack awareness of government schemes, agricultural loans and marketing assistance. Besides, the farmers of west Bengal face a high irrigation problem and the nature of the soil also become vanished due to the chemical fertilizers.
- ④ Merlin Kamala and M Suganya (2016), in the article of pest management in Jasmine states that there are more than 80 jasmine species are found in India out of which only three species are used for commercial cultivation. Their study significance state that Tamil Nadu is attacked by various numbers of pests which cause massive harm to the jasmine plants,
- ⑤ Maria Nijnik et al (2009). in their study paper considers rural land use by analysing stakeholder values and perceptions concerning various landscape components. The purpose is to show that landscape content and landcover interactions with societal connections should be a base for land use development. The practical goal is to deliberate research tools to quantify public opinions and attitudes, which could form bases for developing of decision support tools.

Pre-field survey :- i) Literature Survey to be known with the study area will be very helpful to evaluate the changing pattern.

ii) Finalizing the list of collection of old maps relevant documents etc.

Field Survey: i) Sample survey to interpret the socio economic and demographic data in quantitative and qualitative way,

ii) Questionnaire Survey a structured questionnaire as an added source of data.

iii) Collection of secondary data form from different source like the census, village dictionary, the grampanchayat office.

Post field work :- Analysis of the data collected, Preparation of final map, Table and diagrams and report writing

1.5 Review of Literature

Literature is reviewed on the next page.

- To have knowledge of the infrastructural facilities available in the area and to findout whether they are sufficient enough to meet the changing local needs.
- To identify the various Socio economic Problem.

3.4 Database & Methodology

The methodology which has been followed for data collection is door to door method. I try to approached to each individual's house and asked the question's that had been formulated before the conducting Survey. Data were collected through personal interview, discuss with families members on the assessment spot.

Primary Data

- i) Government documents, Public records
- ii) Interview and discussion

Secondary Data

- i) Text book, Review articles
- ii) Art

Darjeeling district, West Bengal as my study area. The study area is located at the bank of the small water body, Krishnamati which itself has both natural and social significance. The study area is about 15 km north from my institution.

Choice of the study area The subject geography is the study of man-nature relationship. As per Syllabus of the Kalyani University for the honours candidates a socio-economic survey with emphasis on land use has been conducted on behalf of our department on 23rd and 24th December 2021 to fulfill the basic demand of geography I have selected such a village as my study area. Which for its socio-economic growth depends upon a small water body. Not only the human lifestyle but the water body is also being influenced by human behaviour.

1.3 Objective of the study area

- To examine agriculture development
- To study the socio-economic condition of the people of the study area.

1.1 INTRODUCTION

Land use acts as an interface between people and the environment as it forms a unifying concept in which socio-economic and ecologic variables coincide. The ecosystem services and its resources, are significantly positively correlated with land use but some forms of land use degrade ecosystems and the services they provide. Land use has important impacts on the functioning of socio-economic and environmental systems with important tradeoffs for sustainability, food security, biodiversity and the vulnerability of people and ecosystems to global change impacts. Therefore, a single research approach does not suffice for a complete analysis of land use status. Instead, a combination of multiple approaches is necessary for land use status analysis. However, for the sustainable use of land resources, identifying land use status and condition are necessary to protect the limited land resource from unplanned utilization. The aims of this paper are to understand the existing land cover and land use pattern of Belia Khari Mouza and to figure out the socio-economic condition of the study area.

1.2 Location of the study area

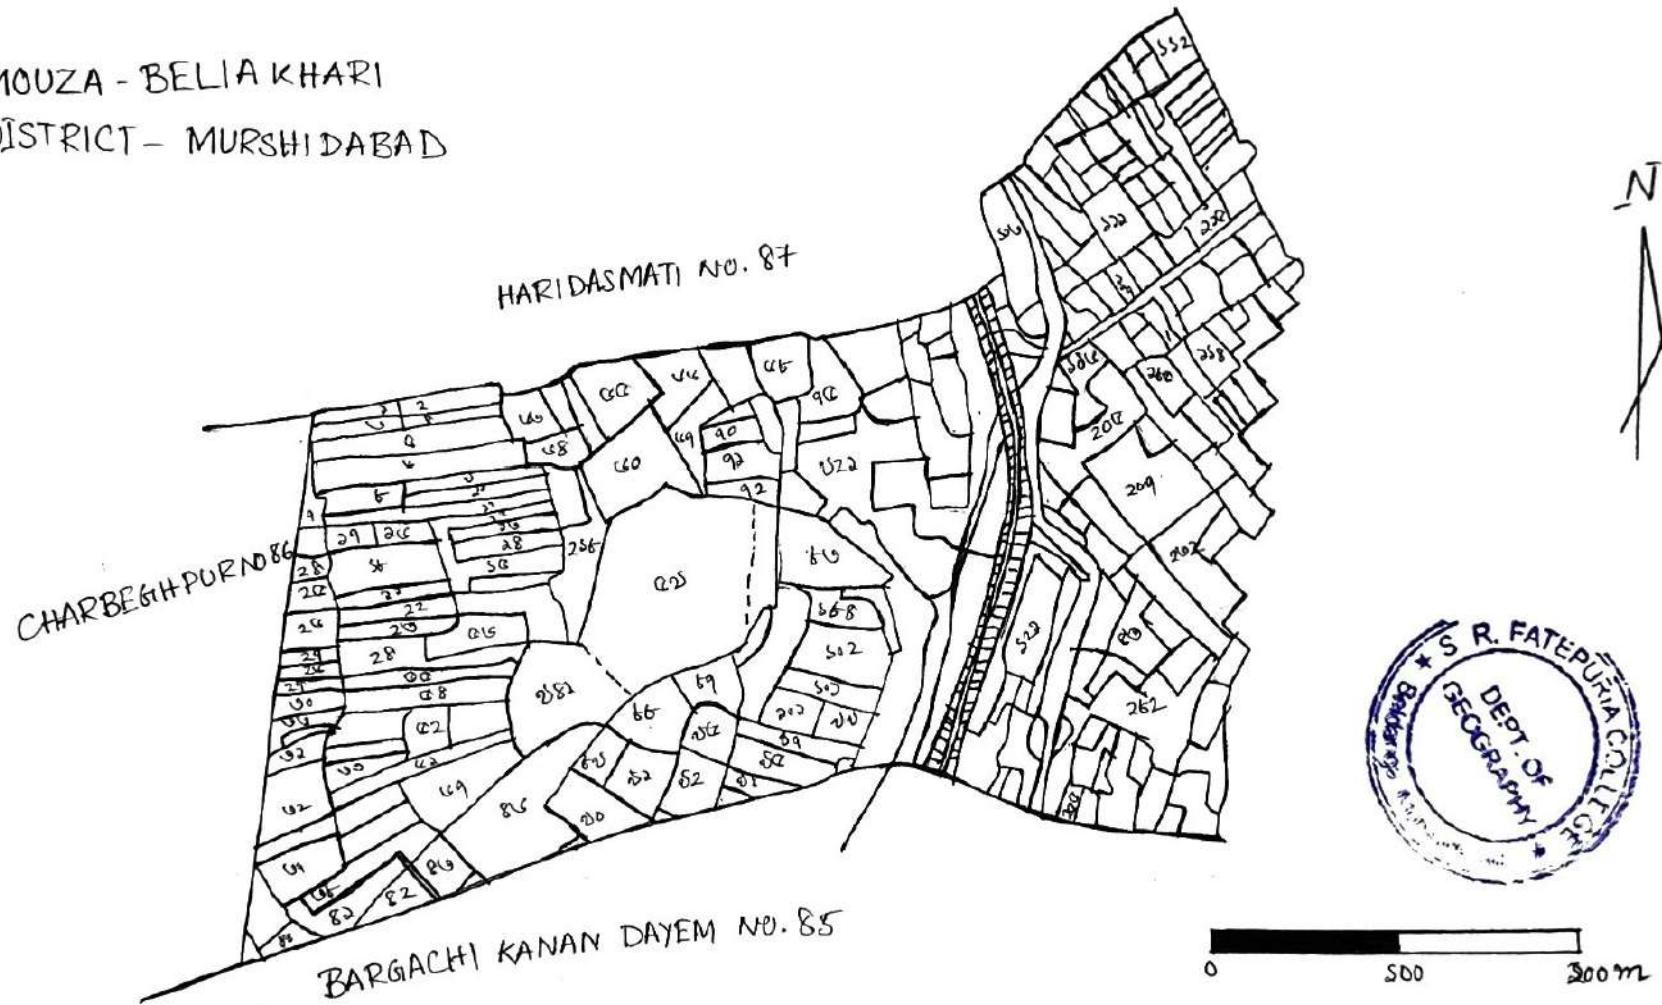

I have selected Belia Khari Mouza under Haridasnali Gram Panchayat of Berham pore block in Murshid-

PROBLEM OF PRESERVATION

Farmers stated that storage is a problem often after the harvesting the crops. There is no good cold storage near the village. sometimes proper preservation of potato is done in the cold storage.

PROBLEMS RELATED TO MARKET

The market related problem include low price of produced crop in market, price fluctuations, distance of the market, market saturation, insufficient profit, insufficient place of selling, informal marketing system, and export problem. At present, most of the farmers are facing problems due to fluctuating market price. In the competitive market economy, the farmers are not getting sufficient profit by selling their produced crop.

ENVIRONMENTAL PROBLEM

The environmental problem is mainly occurred by nature which mainly include problem of climate, disease and pest. Therefore, the environmental damages are seen in all cropping system. sometimes plants or seedlings of flower are ruined due to weather. Environmental damages are found in case of flower farming. More rain, hailstorm and storm destroy the flower plants.

CULTIVATION PROBLEMS OF THE STUDY AREA

PROBLEM OF IRRIGATION

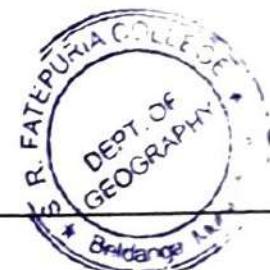

Irrigation is an important problem among the all farmers in this villages. There is no Governmental facility for irrigation in the villages. They do not get any help from the Government in such cases. Due to the development of modern irrigation techniques nowadays farmers in the Study area they face a number of new problems which include power failure; high diesel price; and occasional unavailability of diesel. Besides, high irrigation charge is also a problem particularly faced by the poor farmers.

PROBLEM OF LAND

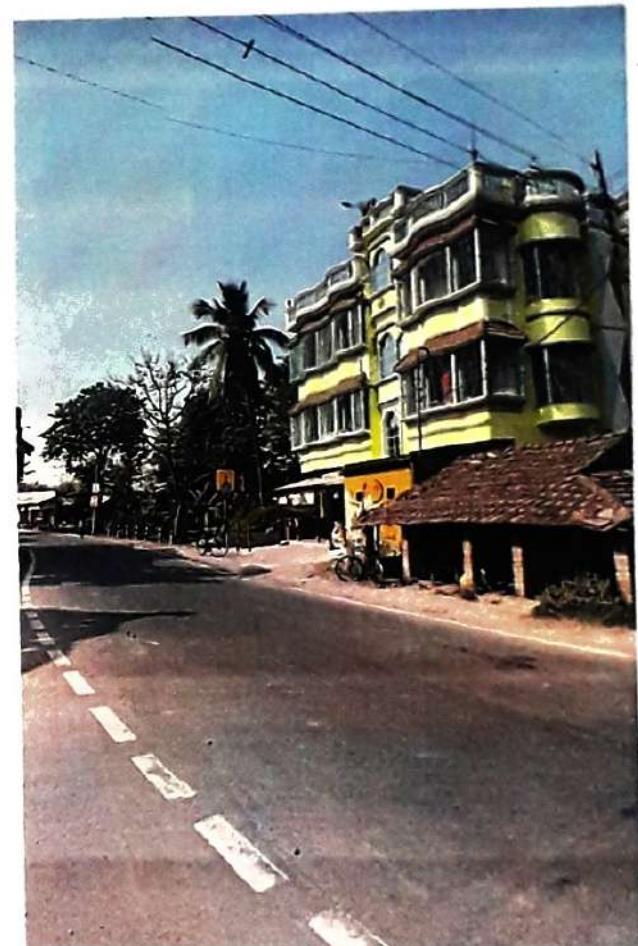

Farming lands in the study area are decreasing day by day due to growth of population and development communication.

PROBLEM OF SOIL

Soil problem is an important issue in farming. The fertility of soils is destroying day after day due to use of more chemical fertilizers. But recently some problems are identified within soil which is an important cause for reduction of potato production.

Settlement Area

LAND USE RELATED PROBLEMS OF THE STUDY AREA

To define a problem it is necessary to establish the present situation, judge ways in which it is unsatisfactory and identify ways in which it might be made better.

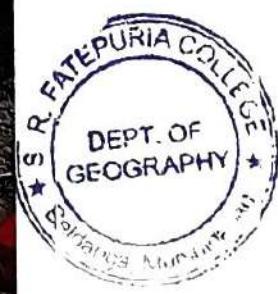

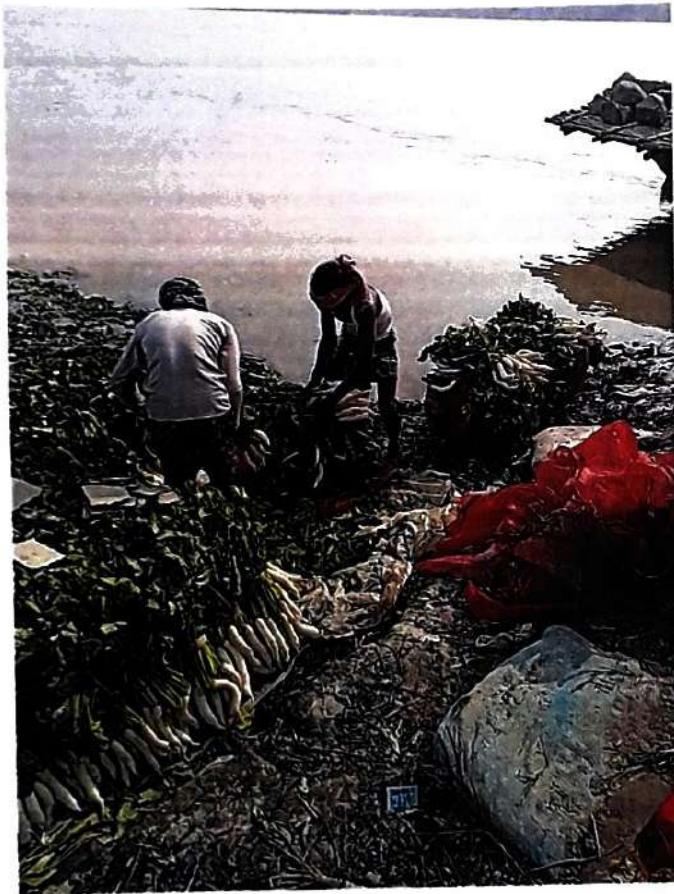

Apart from when planning new settlements on unoccupied land, this stage of diagnosis of problems is of the highest importance. Without identifying problems and analysing their causes, one is in no position to plan for improving the situation. Three closely related methods, any of which can be used at this stage, are farming systems analysis, diagnosis and design and rapid rural appraisal.

The fundamental field survey method may be summarized as:

- Talk to the people
- Look at the land

Land use problems related with wrong land use decision have been a main challenge for humankind.

Occupation Status

ECONOMIC STATUS OF BELJA KHARI MOUZA

PHYSICAL SETUP OF THE STUDY AREA

Geology

Our study area is a place on the upper part of Gangeic delta. It is composed of recent alluvial and the surface consists of sandy clay. On the whole the study at mursidabad district show that fine soil has forms the plane lands.

Topography

Mursidabad district has an average elevation of about 18m (59ft). The study area is also part of a plain land.

Flora

Due to the presence of acidic soil and as result of monsoon climate this region is covered with mango, coconut tree a sal-teak, and bamboo like grass. In fact due to the influence of human activity the flora present to totally in manmade rather than natural.

Soil

About 1-2m of thick brown mottled soil with soft and incipient ferruginous concretion develop on younger deltaic plain. The soil pH ranges from 6.7 to 7.4

Climate

The climate of the study area characterized by an oppressive hot summer and high humidity almost throughout the year. The average annual rainfall in this study area is 1328 mm. The mean daily temperature at 23.8° and 11.9° celsius

CONCLUSION

This study area near Barrampore town in Murshidabad district of West Bengal. Most of the people here are involved in agriculture despite being educated. They are totally depend on ground water as a source of water. They use most of the land for their agriculture. The majority of people are General cast then SC, OBC, ST. There are ~~most male than female~~ large number of male than female.

Education facilities are available. The houses are made by cement, bricks, tile. No public transport are available. In many houses private vehicles are present. The study area's villagers have many cow, goat, duck, hen, buffalo, etc.

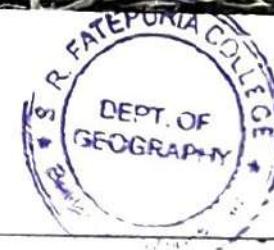

RECOMMENDATION & SUGGESTION

- Roads and other means of communication in the village should be improved.
- Cottage industries should be revived and agriculture should be modernized.
- Village should be electrified to remove the depressing darkness of rural night.
- Village should be educated regarding elementary hygiene and scientific method of cultivation.
- This study area should have a hospital or a primary health centre to provide medical aids to the villagers.
- Rural banking should be set up for financial assistance to the village people.
- Govt. Banks and also NGO's should be providing loans and subsidies to farmer and help to grow farming and also to small scale business.

PREFACE

The Subject geography is multidisciplinary by nature. The subject from different viewpoints are done in this subject includes application of geography knowledge in the study of environment. In this study of socio economic and land use, in the study of tourism growth and in many other sectors. The present work highlight on in the traditional study of geography that is man and environment relationship where an attempt has been made of justify the role of both the agents that is man and environment.

The major geomorphic hazards are tidal ingressions, dual environment and river bank erosion. By this affect the local people's life insecure. Human adjustments to these problems include acceptance technological control and emergency measures. Uttarchar Majhdiar is the home about 1000 families engaged in different types of occupation's like agriculture etc.

Basically the area always eroded by continuous hazard and flood. So we find out many problem and we also find solution about their Uttarchar Majhdiar.

CHAPTER-1

INTRODUCTION

1.1) Location of the study area :-

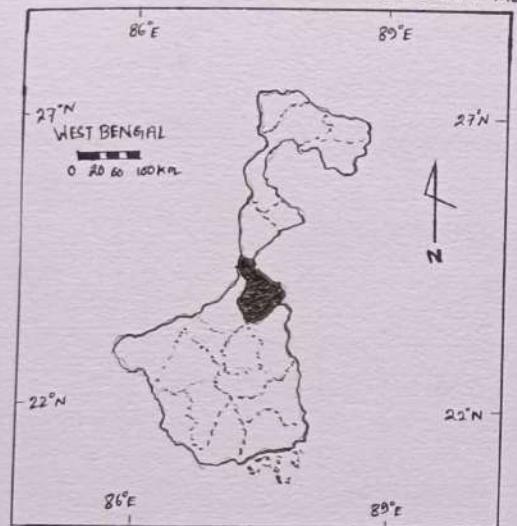

We have selected Uttarchar Majhardiar mouza under Raninagar-II block in Murshidabad district, West Bengal as our study area. The study area is located at the river of Padma, Raninagar which itself has both natural and social significance. The study area is about 54 Km North from our institution.

1.2) Selection of the study area :-

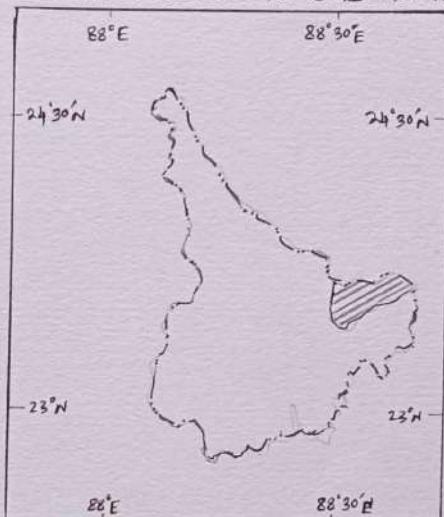

The subject geography is the study of man-nature relationship. As per syllabus of the Kalyani University for the honours candidates 5th Semester a socio-economic survey with emphasis on landuse has been conducted on behalf of our department on 23rd November 2022 to fulfill the basic demand of geography we have selected such a village as our study area which its socio-Economic status influenced upon a river Padma. The Natural Hazard like River bank erosion, flood, cyclone etc influenced Livelihood status of Uttarchar Majhardiar mouza. This context we have selected the study area.

SIGNIFICANCE OF THE FIELDWORK

We study these areas to know about their socio economic conditions, natural hazards of the Uttaranchal Majhardiar. There are river bank erosion hazard such as tropical cyclones, storms, floods, are very much affected in these areas randomly and as a result the Uttaranchal Majhardiar eroded day by day. These areas are very backward to communicate for any kind of information and transport irrigation system is very poor in this area. Their livelihood insecurity of local people lack of infrastructure, power supply and environment pollution degradation caused by other source.

The education level is not also good and most of the people are belonging to BPL category, National Rural Govt. Scheme helps the people in this area. We are finding many types of problem by this Survey. By this Survey we are discuss many problem to protect this area in every way.

ROUTE MAP OF STUDY AREA

SOURCE - NATMO

OBJECTIVE OF THE STUDY AREA

The specific objectives are as follows:-

1. To analyse the existing socio economic and environmental status of the study area in order to identify environmental issues and problems.
2. To assess vulnerability through physical damage analysis of river bank erosion and flooding.
3. To make an economic assessment of this environmental damage based on first hand exploratory survey.
4. To have an overview of prevailing adaption strategies already taken based on questionnaire based survey.
5. To identify the impact level of river bank erosion hazards on local communities.

DATA BASE & METHODOLOGY

Methodology is the systematic, theoretical analysis of the methods applied to a field of study, or the theoretical analysis of the body of methods and principles associated with a branch of knowledge. It typically, encompasses concept such as paradigm, theoretical model, phases and quantitative or qualitative techniques.

In a very general sense, methodology refers to the preparation for the field work which is categorized into three main steps. These are - 1. Pre-field study.
2. Field study 3. Post-field study.

During our field work we also followed the following steps:

1. Pre field study: Pre-field means the work done before the field survey. Our pre-field study includes the collection of various information about the surveyed area on which the entire research work is conducted.

2. Field Study: Our field study is mainly conducted through the collection of primary data from the field with the help of questionnaire. Generally, primary data refers to the data which is collected by the surveyor himself direct from the field.

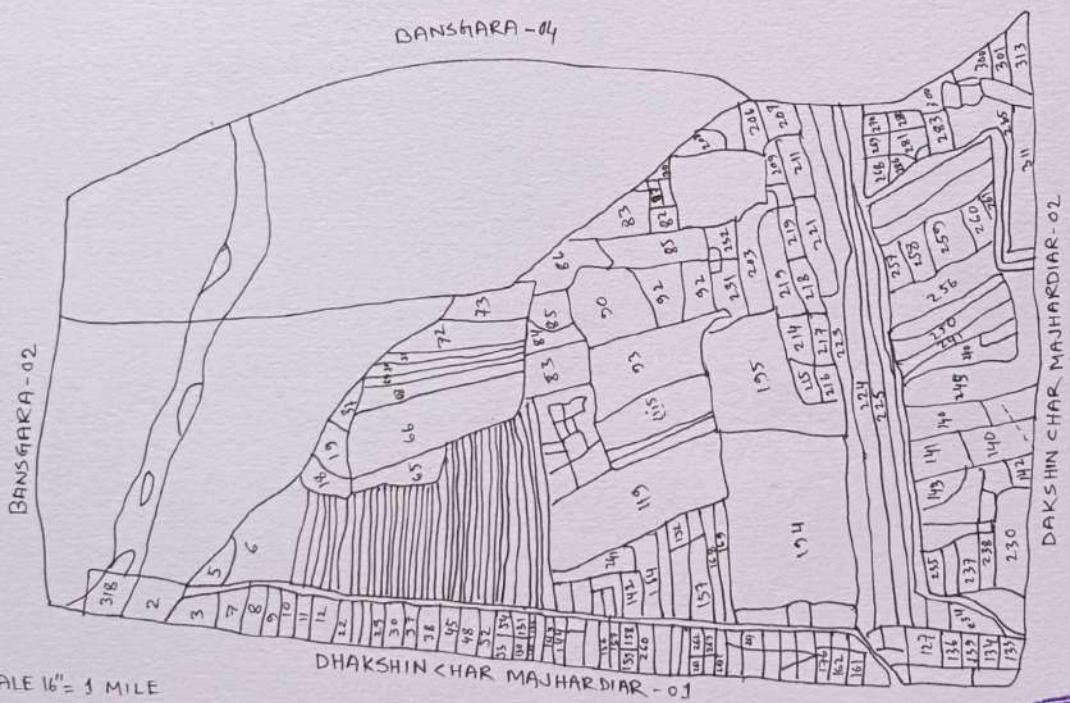

These include:

i. Site visit to Uttar char Majhardiar mouza in order to gain first hand understanding of the nature of the site, its habitats, river bank processes and landscape characteristics and their problems .

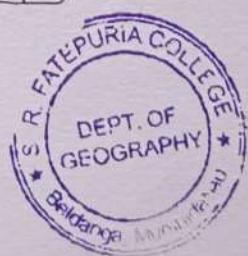

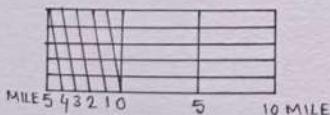

ii. Interaction with the local community and meetings with the officials of relevant government departments working on different issues of the study area.

3. Post-field study: Our post-field study is mainly based on the analysis and interpretation of the primary & secondary data collected from the pre-field & field studies. After the collection of primary data by random sampling Survey through questionnaire we are conducted master table & then different cartographic techniques are applied to present the socio economic data. The next step is interpretation scientific analysis and interpretation is required for the explanation of socio economic data.

CHAPTER- 2

(2) PHYSICAL SET UP OF THE STUDY AREA

2.1) Geology :-

Our study area is place on the beside part of padma river. It is composed of recent alluvial and the surface of sandy clay and sand along the course of the river. On the whole study area of total Raninagar-II block show that natural hazard influenced forms the plane lands.

2.2) Topography :-

Murshidabad district has an average elevation of about 20 mt the study area is also part of a plain area. That the region has negligible relative relief and the study area has a site straight towards the padma river.

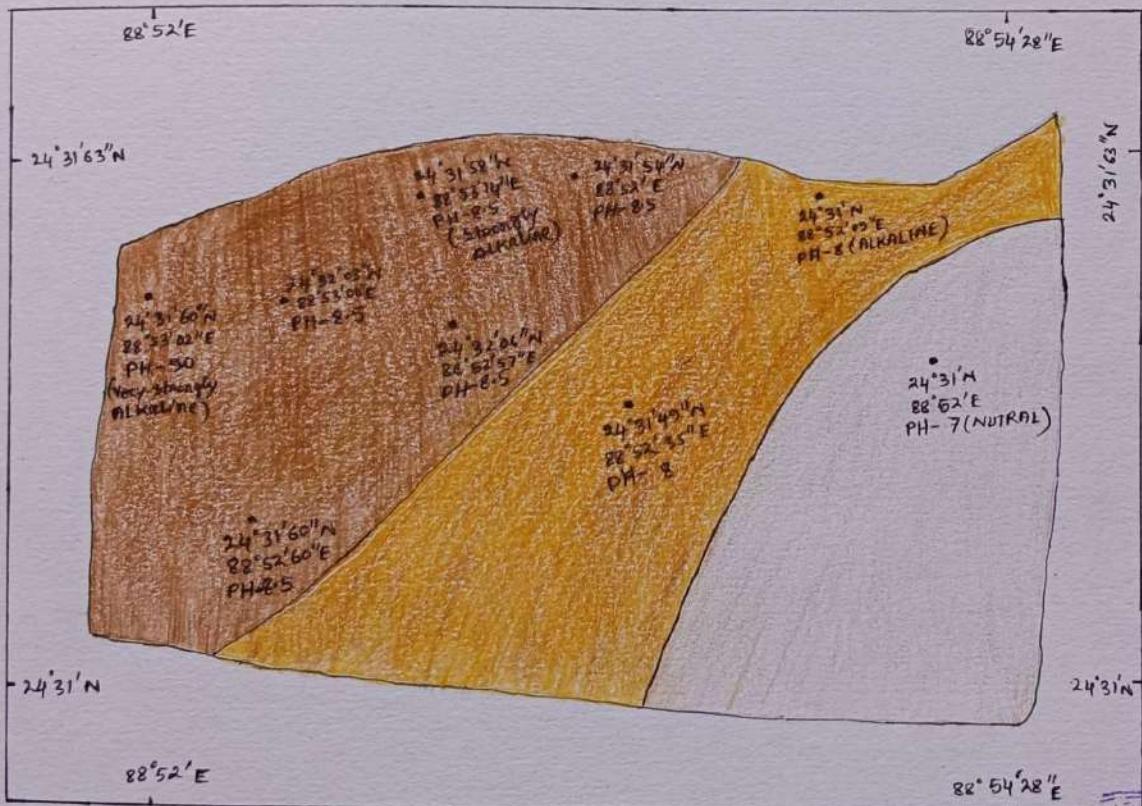

2.3) Climate :-

This region is also affected by this monsoon, statistic based on climate data provides that June is warmest month of the region with on highest temperature of about 40°C . While January is the coldest month with the lowest temperature of 10°C following the study 10 previous years. And annual rainfall about 150-200cm is a common for this area this area through frequent drought has been observed in current years. Climate for the nearest meteorological station at Berhampore is provide the flowing statica.

2.4) Soil :-

Like any other part of the great plain region our study is also cover with alkaline, strong alkaline soil. This areas soil like alluvial type. This soil also good for all over agricultural activities. This areas soil is high Nitrogen and allow to good for agriculture.

SOIL PH VALUE

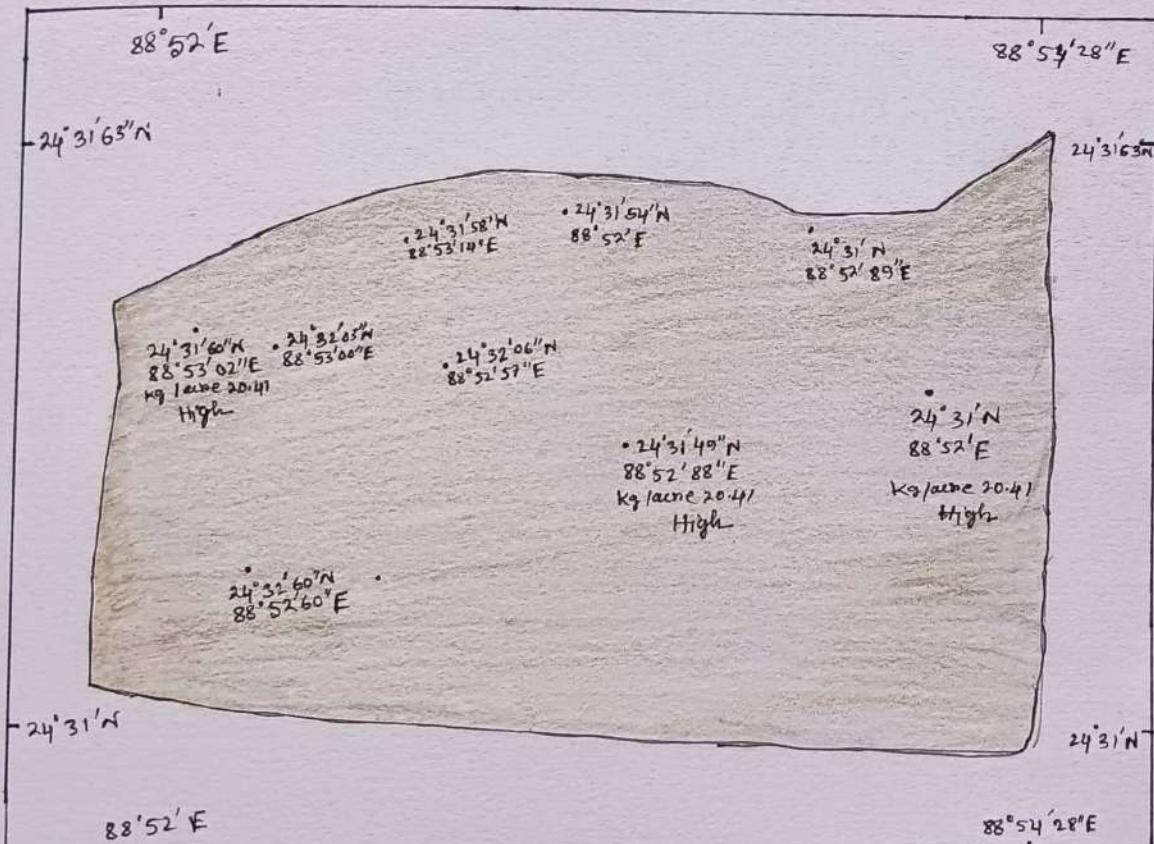

SCALE
KM 100 50 0 100 200 300 MM

SOURCE - FIELD SURVEY 2022

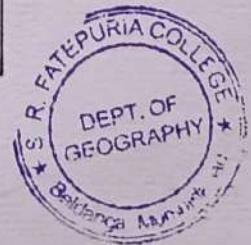

SOIL NITROGEN VALUE

SCALE

SOURCE - FIELD SURVEY 2022

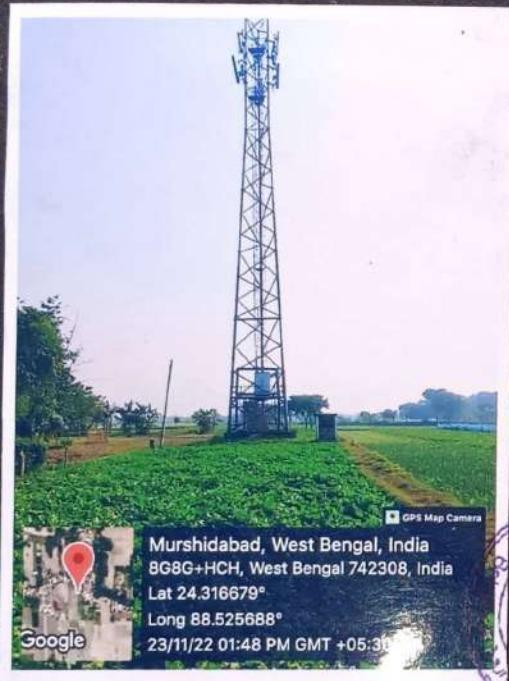

2.5) Drainage: The whole region of the padma plain has a boundary by the river. Then whole region comprises on different water bodies and small water body near by the study area and also use tank water for Agriculture. The small water body in such an evidence of the previous flow of the major river.

2.6) Natural Vegetation and Agricultural field: In the study area is also good for agriculture. In this area is very good for cultivation due to alluvial soils. Along with this, natural trees grow in abundance. In this area, paddy cultivation is very good in monsoon and mustard, dal, lentil cultivation is very good in winter. The trees are very green and big.

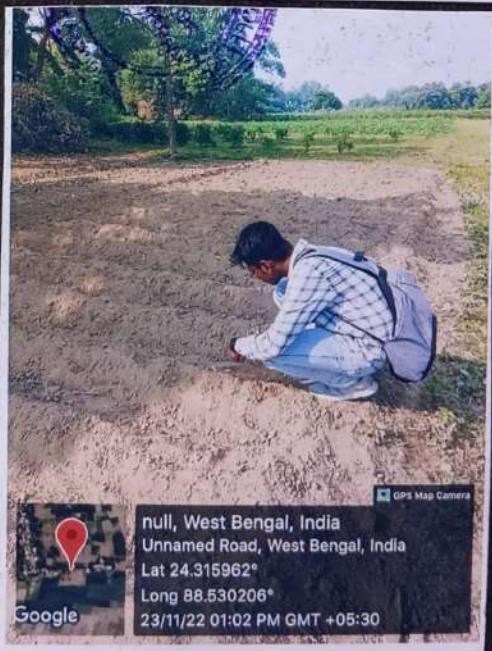

2.7) Flora and Fauna: Fauna is all of the animal life present in a particular region or time. Very types fauna located in the area and the corresponding term for plant is Flora. Very types of flora are seen in the study area water hyacinth, Nelumb nucifera.

CHAPTER- 3

DEMOGRAPHIC STATUS OF UTTAR CHARMAJHARDIAR MOUZA

Table 1.1:- calculation for Pie diagram (Gender)

Gender	No of family	Indegree	Radius of pie	Scale
Male	343	186°14'	$r = \frac{\text{Total}}{360}$ $= \frac{663}{360}$ $= 1.84$ (approx)	1cm to 3unit
Female	320	173°46'		

Our study area of Uttar charm Majhardiar mouza medium size of village under Muzshidabad district. Above the table and graph show that the study area is 51.73% by male population but about 48.26% total population are female.

Table 1.2:- calculation for Pie diagram (Religion)

Religion	No of family	Indegree	Radius of pie	Scale
Hindu	435	236°11'	$r = \frac{\text{Total}}{360}$ $= \frac{663}{360}$ $= 1.84$	1cm to 3unit
Muslim	228	123°49'	$= 2.15$ $= 2.73$	

Our study area of Uttar charm Majhardiar mouza is medium size of village under Muzshidabad district. Above the data Table and graph show that the study area is 65.61% most accured by Hindu population but about 34.38% total population are Muslim.

Table 1:3:- Calculation for Bar graph (Cartesian)

Caste	Total	Percentage	Scale
General	198	29.86	
SC	314	47.36	
ST	59	8.89	
OBC	92	13.87	1cm to 10%

The data table is group show that the study area is mostly assured by schedule caste population 47.36%. General caste is 29.86% of population and Schedule Tribe 8.89 and other Backward caste is 13.87%.

Table 1:4:- Calculation for Pie diagram (Migrated people)

Migrated Family	No of family	In degree	Radius of pie	Scale
Yes	11	28°5'	$r = \frac{\pi r^2}{360}$	1cm to
No	102	331°55'	$= \sqrt{\frac{102}{360}}$	2 unit

The study area of Uttarchaur Majhadiar mouza in Raninagar-I block under Murshidabad district. The data table show that the study area is 92.19% population non-migrated people and migrated people is 7.81%.

DEMOGRAPHIC STATUS OF UTTAR CHARMAJHARDIAR MOUZA

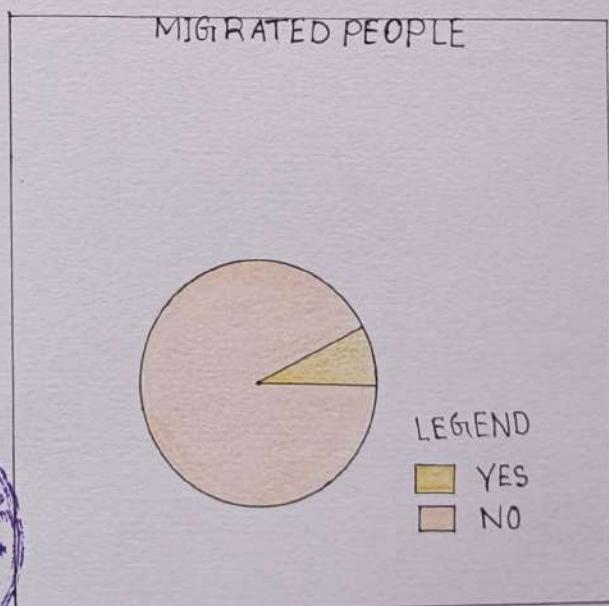

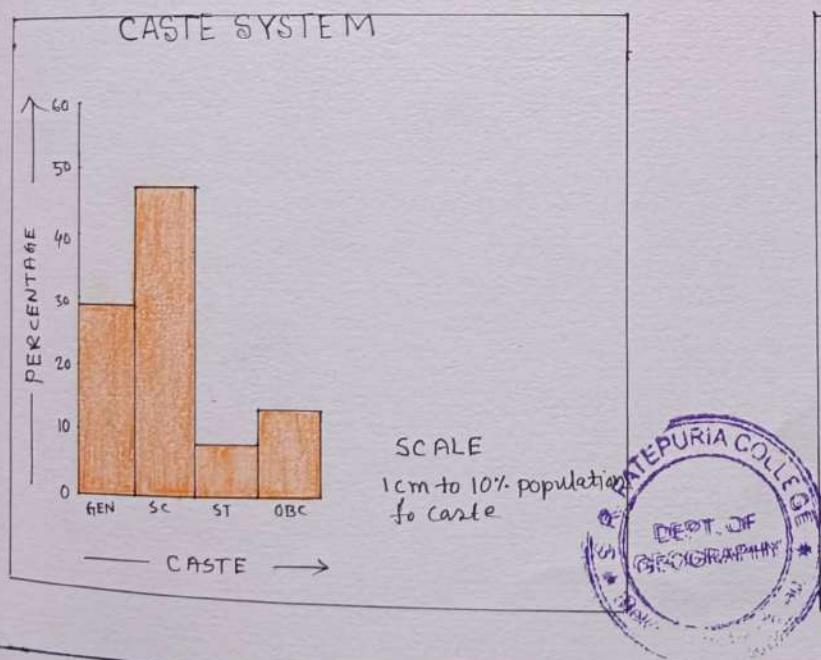

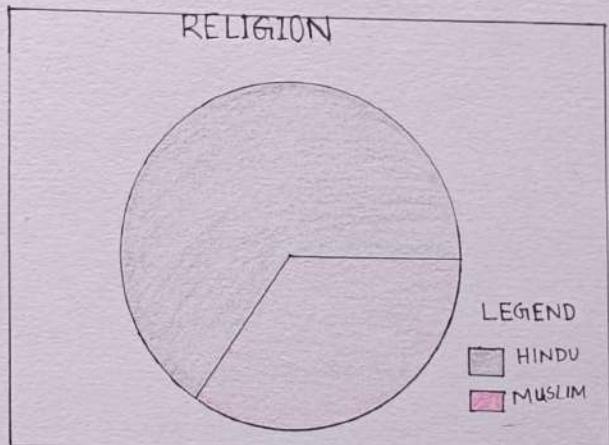

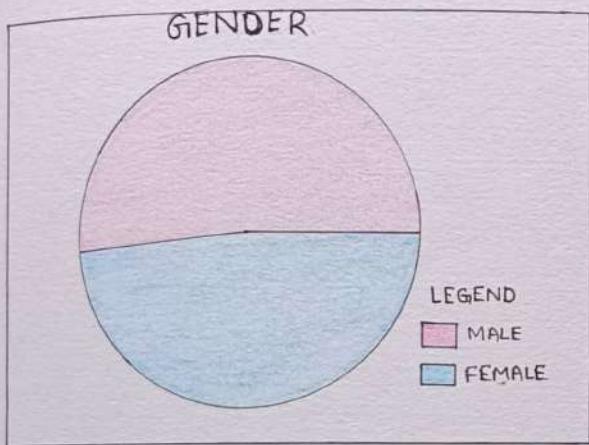

Table 1.5 Calculation for pie (Type of family)

Type of family	No of family	in degree	Radius of the pie	Scale
Joint	38	97°1'	$\pi = \frac{\text{Total}}{360}$ $= \frac{147}{360}$ $= 3.47 \times 1.88$	1cm to 2 unit
Nuclear	102	262°59'		

Our study area is Uttarchar Majhadia is a rural area under Murshidabad district. A look the data table and graph that the study area is maximum population 73.04% family is Nuclear and 26.95% family is joint.

Table 1.6 Calculation for Bar graph (Size of family)

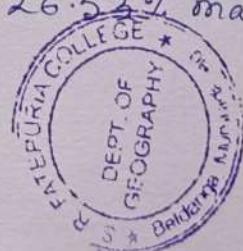

Size of the family	Total	Percentage	Scale
Below 4	59	41.84	1cm to
5-8	74	52.48	10%
above 8	8	5.67	

Both the sample survey and secondary data available from the Uttarchar Majhadia mouza in Raninagar -II block under Murshidabad district. In the study area 41.84% below 4 size of the family and mostly 5-8 size of the family is 52.48%.

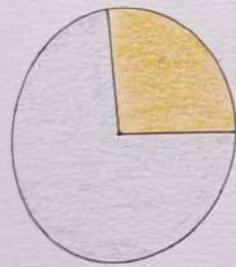

Table 1.7 Calculation for Age Sex pyramid (Age Sex composition)

Age Sex pyramid	No of Male	Percentage	No of Female	Percentage	Scale	Scale based value
						M F
0-5	26	7.58	31	5.68	1cm to	1.51 1.93

CHAPTER-04

LANDUSE CHARACTERISTICS

What is land use :- Landuse refer to the Naturalisation for Socio-Economic benefit of the people. In a different way we may define landuse as the highest possible used of the land cover with least hampering of its sustainability.

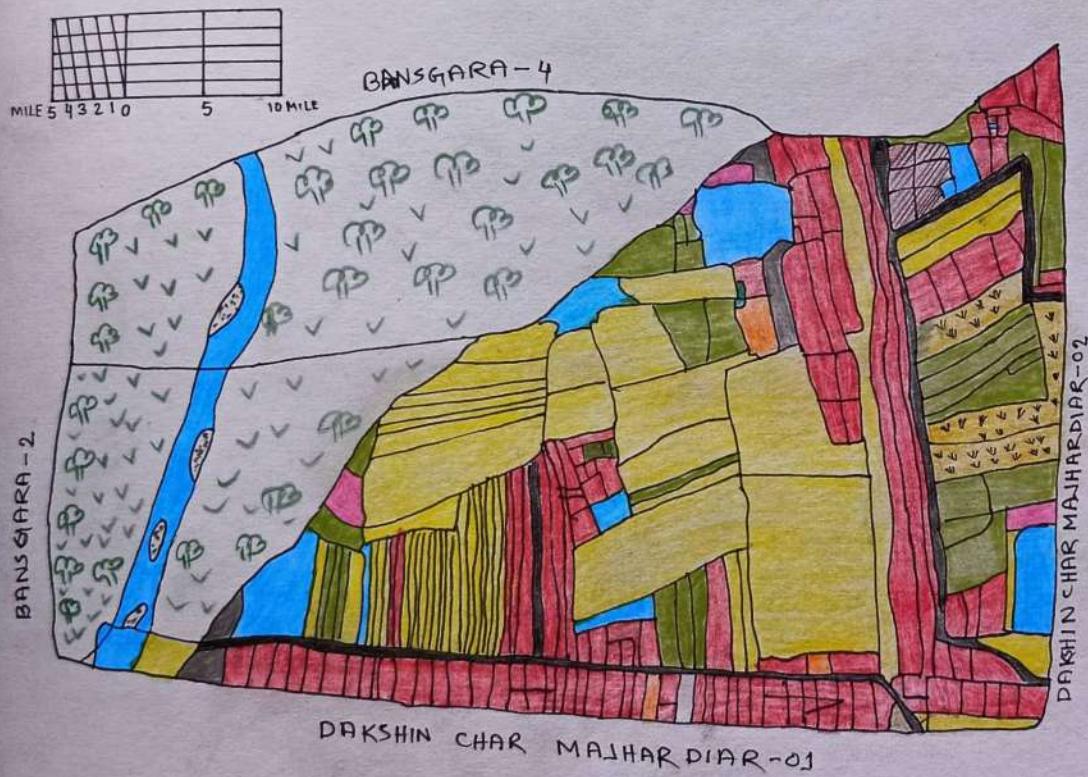

Present Landuse Condition of the study area :- A through survey of land use following in the Uttarchar Majharediar mouza of a area produces the following land use pattern —

- i) Agricultural purpose :- Agricultural purpose about area is under the use of agricultural purpose about work, it can tribute about 55.47% of the total landuse area. The agriculture area used throughout of the year and most of the land use for multicrop production. The crop include winter season.
- ii) Forest area :- It includes orchids of banana, garden and few area reserve for bamboo, It can cover amount of land area with contribute 10.92% of the total mouza.
- iii) Bamboo groves :- 15.45% of land area are used for then purpose . The location of such groves is many abineant to the settlement area zone.
- iv) Settlement area :- According to the land use survey amount to the total land area 59.91% of area which is second in position followed by the agricultural purpose land area. The settlement have been set up mainly following beside the local water body and matali road is covered by settlement is following both the sides .
- v) Transportation purpose :- The presence of metal and non-metal may have been observed in the mouza, it covered about 10.22% amount of land area.

PROBLEM RELATED TO LAND USE

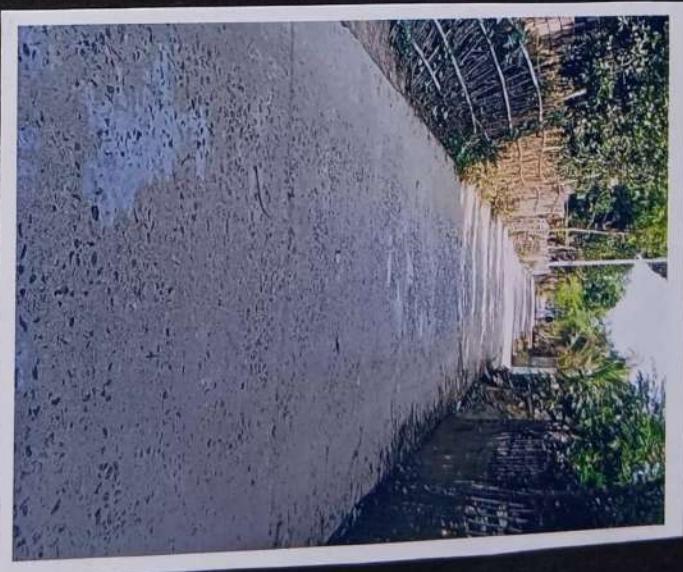

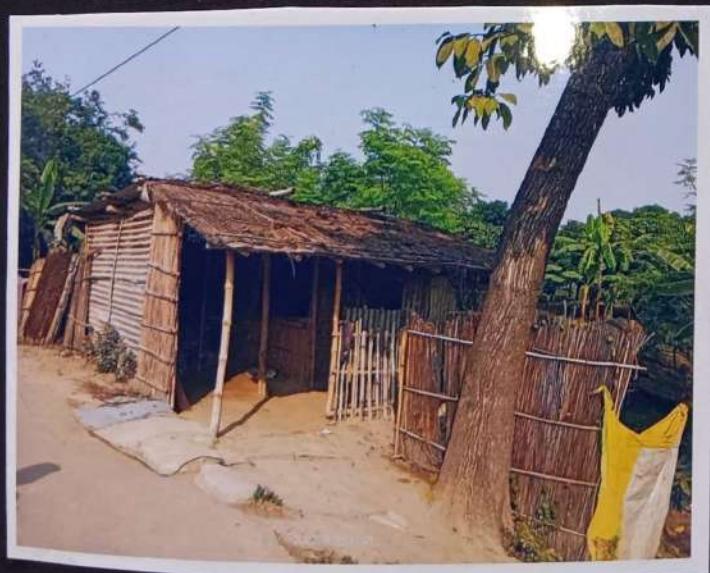

The problem would have been identified its quite common for the villages situated over paddy -

i) The problem are summarised as flows the use of agriculture land through out the year . To crops which growing population of the country like in any other villages here the farmers are also faces of the difficulty in rainy season for heavy rainfall causes of the maximum agriculture land use are drowning . Main problem of the study area are River bank erosion and flood.

ii) Population of the Waterbody :- Through the water body is to the local people but they use the water body is such away that continuous population is degrading its water quality its water quality . Fertilizers that are used in the fields become contaminated with water during rainy season it causes major damage to water quality .

iii) The problem of Soil Erosion :- The continuous used of the field for agricultural purpose not only affecting the concentration of organic matter , pH unbalance of soil , N₂ soil are balanced . But also causing the soil erosion specially by channel flow water during wet season and wind flow during dry season .

Very types of landuse in study area

CHAPTER- 5

RIVERBANK EROSION & HAZARD STUDY

A hazard is a situation that poses a level of threat to life, health, property, or environment. Most hazards are dormant or potential, with only a theoretical risk of harm, however once a hazard becomes "active" it can create an emergency situation. A hazard's situation that has come to pass is called an incident. Hazard and possibility interact together to create risk.

Identification of hazard risks is the first step in performing a risk assessment.

River Bank erosion hazards are physical phenomena that expose a bank area to risk of property damage, loss of life and environmental degradation.

River Bank Erosion & Hazard Study

HAZARD & RIVERBANK EROSION IN UTTARCHAR MAJHARDIAR MOUZA

Table 4.1 calculation for pie (Experienced about Hazard)

Experience about Hazard	No of family	In degree	Radius of the pie (m)	Scale
Yes	89	227°14'	$n = \sqrt{\frac{Total}{L}}$ = $\sqrt{\frac{101}{L}}$ = 3.77	1cm to 1 unit
No	52	132°46'		

The area of, Uttarchar Majhardiars mouza in Muzshidabad district. This area's maximum population face many problem too natural hazard. Mostly 63.12% people experience about Natural hazard.

Table 4.2 calculation for Bar (Type of Hazard) —

Type of Hazard	No of family	Percentage(%)	scale
Flood	68	51.90	
River Bank Erosion	43	32.82	1cm to 10%
others	20	10.68	

Our study area is faced many natural hazard like flood, river bank erosion, cyclone etc. Above the table 51.90% family told that we difficult situation about flood and 32.82% family asked suffer about River bank erosion.

Table 4.3 calculation for Bar (causes of Flood Hazard)

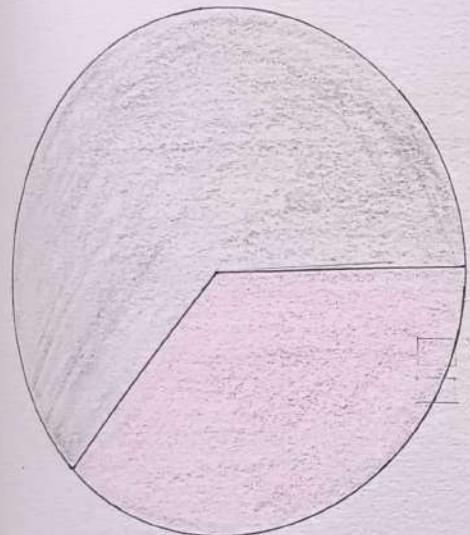

Causes of Flood	No of family	Percentage(%)	scale
Destruction of dam	48	36.64	
High rainfall	69	52.67	1cm to 10%
others	11	10.68	

Both the sample of survey and secondary data available maximum people 52.67% asked about causes of flood too High rainfall and 36.64% family asked causes of flood for destruction of dam.

Table 4.4 Calculation for Bar (change after Hazard)

change After Hazard	No of family	Percentage	scale
Destruction of embankment	10	7.51	
Loss of agriculture land	60	45.11	1cm to
Destruction of River Bank	32	24.06	10%
Residential destruction	22	16.54	
Loss of local rain	9	6.76	

The study area Uttaranchal Majhardiar mouza is a natural hazardic area. According to the people in the area 45.11% loss of agricultural land for hazard. Natural Hazard are bad affect on the agriculture land and 24.06% of total population asked affect the destruction of river bank erosion in the area.

Table 4.5 calculation for Bar (most problem of the village) —

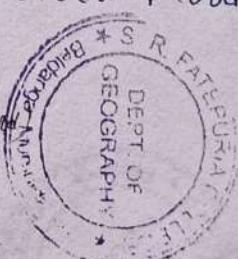

most problem of the village	No of family	Percentage	scale
River Bank Erosion	45	31.91	
cyclone	20	14.18	1cm to
Flood	40	28.36	10%
others	36	25.53	

Most critical problem of the uttaranchal Majhardiar village is 31.91%. total population asked River Bank Erosion is the most problem in the area. Above the table 28.36% people said trees for Flood.

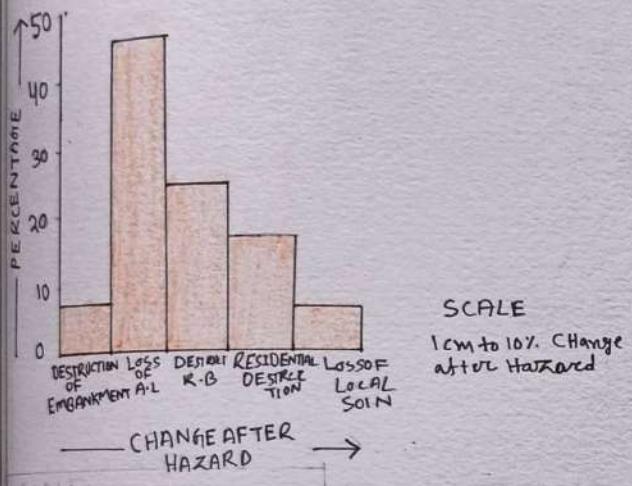

Table 4.6 calculation for Pie (shifted house due to Hazard)

Shifted House	No of family	In degree	Radius of the pie	scale
Yes	45	115° 00'	$\frac{115}{360} \times \pi r^2$	1cm to
No	56	245°	$\frac{245}{360} \times \pi r^2$	2 unit

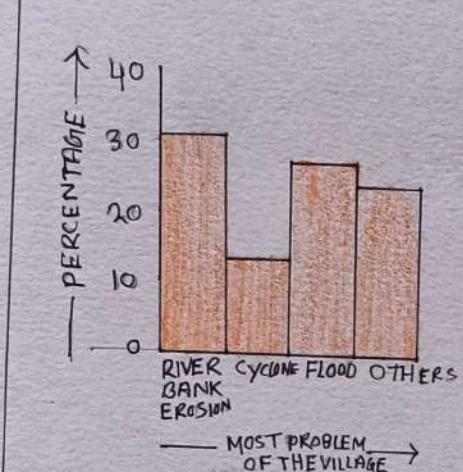

Our study area is Uttaranchal Majhardiar mouza's 31.91% people shifted our house due to river bank erosion and 68.08% people asked we area not shifted our house due to river bank erosion.

CHANGE AFTER HAZARD

MOST CRITICAL PROBLEM OF THE VILLAGE

SHIFTED HOUSE DUE TO HAZARD

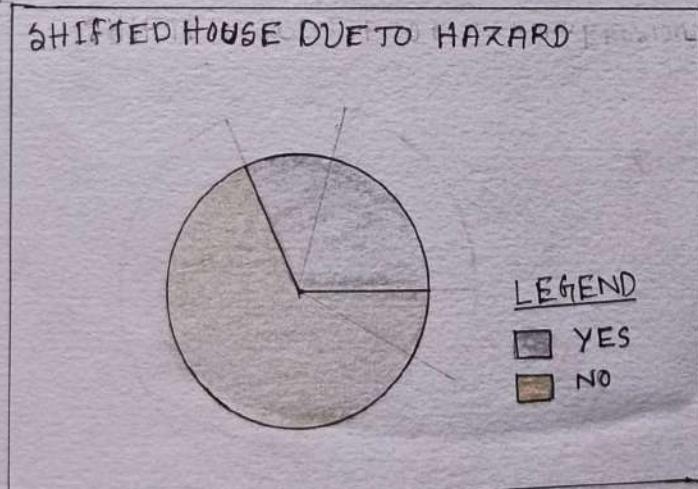

Table 4.7 calculation for barc (shifted house to River Bank erosion)
of next few month

shifted house in next few month	No of family	percentage	scale
Very likely	11	7.80	
Likely	20	14.18	1cm to
Not sure	39	27.65	
Unlikely	40	28.26	10'.
Very unlikely	31	21.93	

In indicates the concentration of shifted house due to river bank erosion in next few month 27.65% of total population not sure about shifted their house in natural hazard.

Table 4.8 calculation of pie (Intension to leave the village)

Intension to leave the village	No of family	Indegree	Radius of pie	scale
Yes	42	107°14'	$\theta = \frac{\text{Total}}{360} \times 360^\circ$ $= \frac{107}{11} \times 360^\circ$ $= 3.77 \times 360^\circ$ $= 1.82$	1cm to 2 unit
No	99	252°46'		

Our study area is Uttaranchal Majhadiar in Raninagar - 2 block on Muzshidabad district. Above the table 90.21% total of population said about not interested intension due to leave the village and 29.78% family imagined about intension to leave the village.

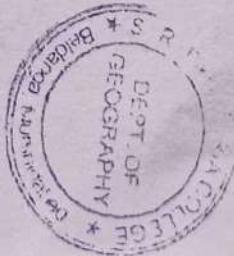

Table 4.9 calculation of pie (Lost all or part of agriculture land)

Lost all or part of agriculture land	No of family	In degreee	Radius of pie	Scale
All agriculture land	49	125°	125/360 = 1.14 = 3.77 = 1.82	1cm to 2unit
Part of agriculture land	92	235°		

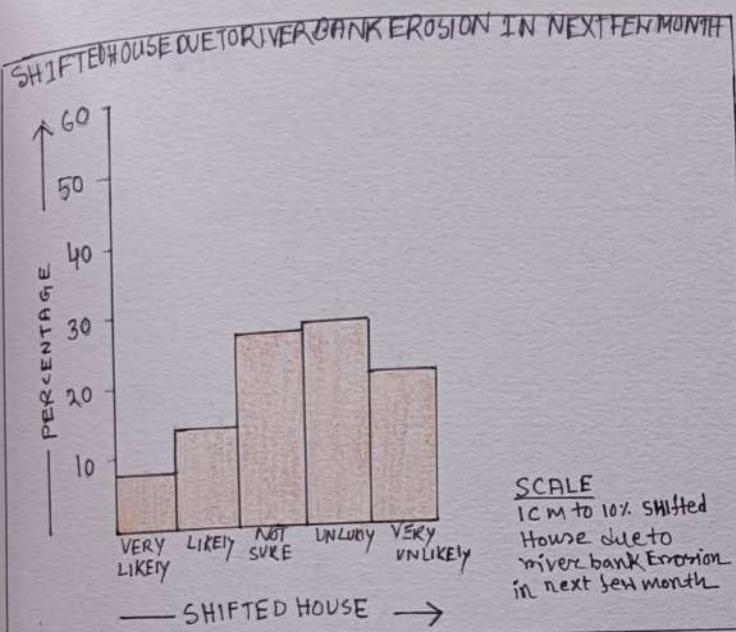

Indicates the concentration of lost all or part of agriculture land in Nature Hazards. Above the table 65.24% peoples lost part of agricultural land and 29.78% people losted our all agricultural land. Mostly populated faces many problem in the uttarbari Majhadia mouza.

Table 4.10 calculation of base (Lots of assets due to river bank erosion)

Lots of assets due to R.B.E	No of family	Percentage	Scale
house	36	25.53	
cattle	45	31.10	1cm to 10%
others	60	42.35	

The study area is uttarbari Majhadia mouza at living in the village mostly suffer on the other damages for lots of assets due to river bank erosion and 25.53% of total due to river bank erosion.

CHAPTER-6

FINDING AND CONCLUSION

Finding: Uttar char Majhardiar is the most important part of Kaminegarh block. This area situated in the eastern part of Murshidabad district. In socio-economic status this study area has been considered as background region. Through my micro level research work I have found the following points:

1. Uttar char Majhardiar is losing its large parts of agricultural land due to maximum river bank erosion of the study area.
2. The study area is considered as a river bank erosion prone zone. So the soil of that area is alluvial in nature, enclosed with recent alluvial type.
3. Uttar char Majhardiar is a less economically area. Most of the people are join with primary activities. So other income is very low and they belong to BPL category. But some people are join with the pisciculture.
4. Poor health facilities have been found in the study area. Only one sub health centre of the area. Most doctors are untrained in this area. As a result huge numbers of patients do not get proper treatment. Transport system is still poor in the study area. Only a terminating bus route is considered as the life line of the study area.

Conclusion :- Uttar Char Majha Daire is a river bank erosion area, here maximum time local people are greatly affected by the river bank erosion, here is a need construction, stop river bank erosion, construction of embankment, hospital in the study area. But now the present condition of the study area is very worst to lead the daily life for the local people. There local people are engaged by primary sectors like for Agriculture, fishing etc. different caste and religions are found in the study area. We survey at there, be survey about their socio-economic condition and hazard perception of this area. We find their man and environment relationship for their livelihood. Thus the main focus of the social condition is to study the size of population, distribution and density of population, level of education, economic behaviour, civic amenities etc. We survey at there be survey about their socio-economic condition and hazard perception of the study area. We find there man and environment relationship for their livelihood.

From our surveyed statement, there are many problems to protect the Uttar Char Majha Daire immediately the government must be taken some steps or investment.

14. Size of land holding: landless/marginal/below 1 bigha/large/above 1 bigha

15. Land use: residential/ commercial/orchard/others

16. Distance the agricultural land from their habitat:
 17. Cropping pattern: single/double/multiple
 18. Name of the crop seasonally:

SUMMER:

WINTER:

RAINY:

19. Irrigation system:
 20. Use of agricultural products: personal /commercial
 21. Approx monthly /seasonally income from agriculture:
 22. If they are involve in fishing :
 23. Season of fishing:
 24. Sources of fishing: river/pond/both
 25. Distance the sources from their habitat:
 26. Use of the products : personal/commercial
 27. Availability of the fish market: yes/No
 28. Distance of the market:
 29. Total monthly income of the family: below 3000/3000-6000/6000-8000/above8000
 30. Type of house: kachha/pacca/semi pacca
 31. Material used: bamboo/wood,straw/cement/others
 32. Source of drinking water: public place/well/tube-well/others(name)
 33. Source of fuel:wood/cow-dung cake/L.P.G/others
 34. Electric facility: yes/No
 35. What kind of electric device are used:
 mobile/television/computer/internate/AC/others
 36. Mode of communication : private /public transport/others

37. TYPE OF DISEASES:

Name	Viral Fever	Diarrhea	Cholera	Checken pox	others
Seasons					

38. MEDICAL FACILITY:

MEDICAL FACILITY	HEALTH CENTRE	HEALTH ATTENDENT
HOMEOPATHIC/AYURVEDIC/OTHERS	PHE/POSTIAL/N.H/OTHERS	UNTRAINED DOCTOR/ TRAINEE DOCTOR/QRACK DOCTOR/OTHERS

39. NO OF ANNENITIES:

Item	PHE	HOSPITAL	NH	BANK	MARKET	TEMPLE	MOSQUE	CHARCH	PLAY GRPUND
Name									
distance									

40. AWARNESS OF GOVT FACILITIES:

- A) Education purpose
 B) Shelter purpose
 C) Sanitation purpose
 D) Future planning purpose

HAZARAD PERCEPTION SURVEY

1. Do you any experienced in your area? Yes/No
2. What type of hazard you have experienced in your area? Flood/river bank erosion/any other
3. Do you know about main causes of repeated flooding/river bank erosion
4. What are the main causes of these hazards?

Flood	Destruction of dam	High rainfall	others	
River bank erosion	Tidal effect	cyclone	others	
cyclone	Tidal effect	Lack of shade/big trees	others	

5. What are the changes observed due to hazards?

Flood	Destruction of embankment	Loss of agricultural fields	Loss of local soil cover	others	
River bank erosion	Destruction of embankment	Loss of agricultural fields	Residential area destruction	others	
Cyclone	Destruction of river coast	Loss of agricultural fields	Residential area destruction	others	
others					

6. What is the most critical problem being faced by the village
 - A. River bank erosion
 - B. Dune encroachment
 - C. Cyclone
 - D. Flood
 - E. Others
7. Which are the most hazardous month of the year and why

8. Have shifted your house due to river bank erosion yes/No
9. Do you think you will have to shift your house within next few years from now:

- A. Very likely
- B. Likely
- C. Not sure
- D. Unlikely
- E. Very unlikely

10. Do you intend to leave your village because of the problem you are facing: yes/No
11. Have you lost all or part of your land due to riverbank erosion
 - A. All agricultural land
 - B. Part of agricultural land
12. Have you lost any other assets due to natural hazards
 - A. HOUSE
 - B. CATTLE
 - C. OTHERS
13. Have you changed your profession from farming due to river bank erosion:yes/No
 - A. Fishing
 - B. Daily wage worker
 - C. Shop
 - D. Others
14. In which time of the year your agricultural land faces maximum problem:
 - A. Pre-monsoon
 - B. Monsoon
 - C. Post monsoon
15. Are you satisfied with the embankments constructed to prevent river bank erosion: yes/No
16. Which agency maintains the embankment in your village:panchayat/irrigation and water way/not sure/other
17. Do you think the embankment will collapse under heavy rainfall:

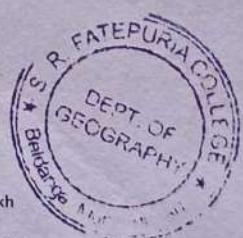

Very likely/likely /not sure/unlikely

18. Do you know any family who have lost their houses and land due to breaching of marginal embankments:
19. Have they received any compensation from government:
20. Do you think plantation along the marginal embankment can reduce erosion problem: yes/no
